So if we try to compare our http methods with doctor skill's functionality which doctor provides to the patient then :

Request methods

1. GET - Going for a consultation to get a check up

2. POST - Going to get a new kidney inserted

3. PUT - Going to get a kidney replaced

4. DELETE - Going to get a kidney removed

Your logic is like a doctor

Request methods
1. GET - Going for a consultation to get a check up
2. POST - Going to get a new kidney inserted
3. PUT - Going to get a kidney replaced
4. DELETE - Going to get a kidney removed

HTTP methods provide additional functionality to your data using the POST, PUT, and DELETE requests. The POST request method creates new data in your server, while PUT updates existing information. The DELETE request method removes the specified data.
